QUALITY THAT STEEMS FROM TRADITION

Grain drying is a proven and safe process for preserving grain quality and creating storage stability. Furthermore, in times of climate change, the concept of energy efficiency also plays a central role in the field of drying. The company ZUTHER offers high-quality, energy-returning dryers, which enable large quantities to be processed and made storable without any problems during the harvesting season. We supply drying plants from the entire performance spectrum for a wide range of products with various heating options. All plants are of modular design, offer a long service life and operate highly efficiently. Especially the advanced energy saving measures further increase the economic efficiency. The entire system is exceptionally flexible in terms of equipment and construction. This means that solutions can also be found for unusually limited installation sites.
